

OWASP DEPENDENCY-TRACK

Community Meeting
June 2026

Organizational

- Community meetings are recorded and uploaded to [YouTube](#)
- Slides will be published in the [DependencyTrack/community](#) repository
- Please use the Zoom chat to ask questions during the presentation
- There will be an open Q&A section towards the end

Agenda

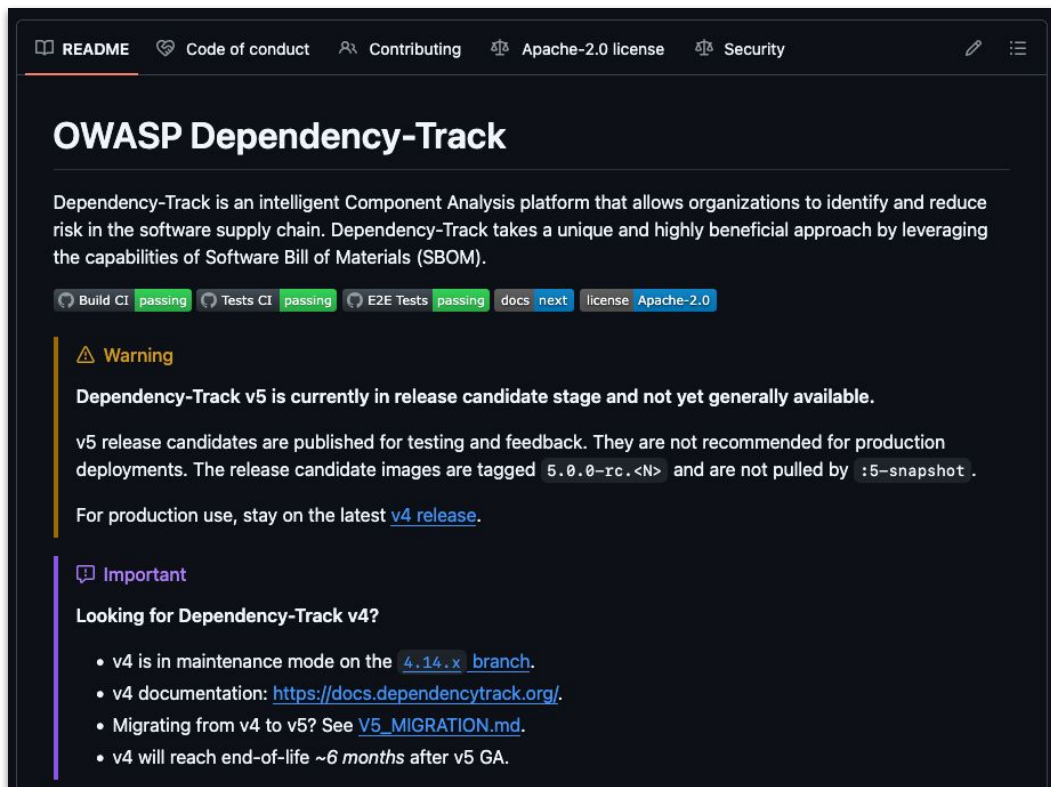

1. v5 Update
2. Q&A

v5 Update

v5 Update - GA Cutover Status

- v5 cutover announced via:
 - README.md files ✓
 - V5_MIGRATION.md files ✓
 - Pinned GitHub Discussions ✓
 - Community Slack ✓
- v4 master branch frozen ✓
- Code from hyades-* repositories migrated to main repos ✓
- 5.0.0-rc.1, 5.0.0-rc.2, 5.0.0-rc.3, 5.0.0-rc.4 released ✓
- Addressed user issues / feedback for RC releases ✓
- Final GA release planned to happen this week
- Official announcement / marketing with short delay

v5 Update – README notices

The screenshot shows the top navigation bar of the OWASP Dependency-Track repository with links for README, Code of conduct, Contributing, Apache-2.0 license, and Security. The main heading is "OWASP Dependency-Track". Below it, a paragraph describes the platform as an intelligent Component Analysis tool for identifying and reducing risk in the software supply chain. A row of status badges follows: Build CI (passing), Tests CI (passing), E2E Tests (passing), docs (next), and license (Apache-2.0). A yellow warning icon precedes a section titled "Warning" which states that v5 is in release candidate stage and not yet generally available. It explains that v5 release candidates are for testing and feedback, not for production, and are tagged with `5.0.0-rc.<N>` and pulled by `:5-snapshot`. It advises users to stay on the latest [v4 release](#) for production use. Below this, a purple important icon precedes a section titled "Important" with the heading "Looking for Dependency-Track v4?". A bulleted list provides information about v4's maintenance status, documentation link, migration guide, and end-of-life timeline.

README Code of conduct Contributing Apache-2.0 license Security

OWASP Dependency-Track

Dependency-Track is an intelligent Component Analysis platform that allows organizations to identify and reduce risk in the software supply chain. Dependency-Track takes a unique and highly beneficial approach by leveraging the capabilities of Software Bill of Materials (SBOM).

Build CI **passing** Tests CI **passing** E2E Tests **passing** docs next license Apache-2.0

Warning

Dependency-Track v5 is currently in release candidate stage and not yet generally available.

v5 release candidates are published for testing and feedback. They are not recommended for production deployments. The release candidate images are tagged `5.0.0-rc.<N>` and are not pulled by `:5-snapshot`.

For production use, stay on the latest [v4 release](#).

Important

Looking for Dependency-Track v4?

- v4 is in maintenance mode on the `4.14.x` branch.
- v4 documentation: <https://docs.dependencytrack.org/>.
- Migrating from v4 to v5? See [V5_MIGRATION.md](#).
- v4 will reach end-of-life ~6 months after v5 GA.

Notice in DependencyTrack/dependency-track's README.md

v5 Update – Hyades archived

hyades-apiserver Public archive
Fork of the Dependency-Track API server. It includes various changes necessary to work with Hyades.
● Java ☆ 24 📄 Apache-2.0 🍴 37 ⌚ 0 🔗 11 Updated 5 days ago

hyades-frontend Public archive
Fork of the Dependency-Track frontend. It includes various changes necessary to work with Hyades.
● Vue ☆ 9 📄 Apache-2.0 🍴 27 ⌚ 0 🔗 46 Updated 5 days ago

hyades Public archive
Incubating project for decoupling responsibilities from Dependency-Track's monolithic architecture into separate, scalable services.
● Makefile ☆ 105 📄 Apache-2.0 🍴 42 ⌚ 0 🔗 5 Updated 5 days ago

v5 Update – Migration tooling & guide

The screenshot shows the Dependency-Track v5 migration guide page. The page has a dark blue header with the 'Dependency-Track' logo, a 'next' dropdown, a search bar, and a repository link 'DependencyTrack/depende...' with 4.14.2 version, 3.9k stars, and 741 forks. The navigation menu includes Home, Tutorials, Guides, Concepts, Reference, and Blog. The left sidebar lists 'Guides' under 'User guides' (Organizing projects into hierarchies, Managing project versions, Managing component policies, Triaging policy violations, Managing vulnerability policies, Managing private vulnerabilities, Configuring notification alerts, Managing secrets) and 'Administration guides' (Deploying to production, Scaling, Configuring the database, Configuring secret management, Configuring internal CA trust, Configuring an HTTP proxy, Configuring vulnerability sources). The main content area shows the breadcrumb 'Home > Guides > Administration guides' and the title 'Migrating from v4 to v5'. The text describes the migration process, mentioning the 'v4-migrator' command-line tool and the need for v4 to be offline. It also provides links for 'per-release upgrade pages', 'Running v4 and v5 in parallel', and 'Rehearsing the v4 to v5 migration'. A red box highlights the final sentence: 'To walk this migration end to end against a sandbox v5 stack before the production cutover, see [Rehearsing the v4 to v5 migration](#).' The right sidebar contains a 'Table of contents' with links to 'How the migration works', 'Before you start', 'Recommended Postgres tuning', 'Run the migration' (with a numbered list of 7 steps), 'Lossy and non-obvious changes' (with links for username collisions, user records without a username, portfolio access control bypass, and dedup of teams, OIDC groups).

Guides

User guides

- Organizing projects into hierarchies
- Managing project versions
- Managing component policies
- Triaging policy violations
- Managing vulnerability policies
- Managing private vulnerabilities
- Configuring notification alerts
- Managing secrets

Administration guides

- Deploying to production
- Scaling
- Configuring the database
- Configuring secret management
- Configuring internal CA trust
- Configuring an HTTP proxy
- Configuring vulnerability sources

Home > Guides > Administration guides

Migrating from v4 to v5

This guide walks you through moving production data from Dependency-Track v4 (Postgres or Microsoft SQL Server) into a new Dependency-Track v5 instance (Postgres only).

The migration is a one-shot, offline operation performed by the `v4-migrator` command-line tool. The tool extracts rows from your v4 database, transforms them inside the Postgres cluster backing the v5 deployment, and loads them into the v5 schema. v4 must be offline for the duration. The tool does not write to the v4 source.

If you only need to step a v5 deployment between v5 releases, this guide is not for you. See the [per-release upgrade pages](#) instead.

To try v5 against your real workload before committing to the migration, see [Running v4 and v5 in parallel](#).

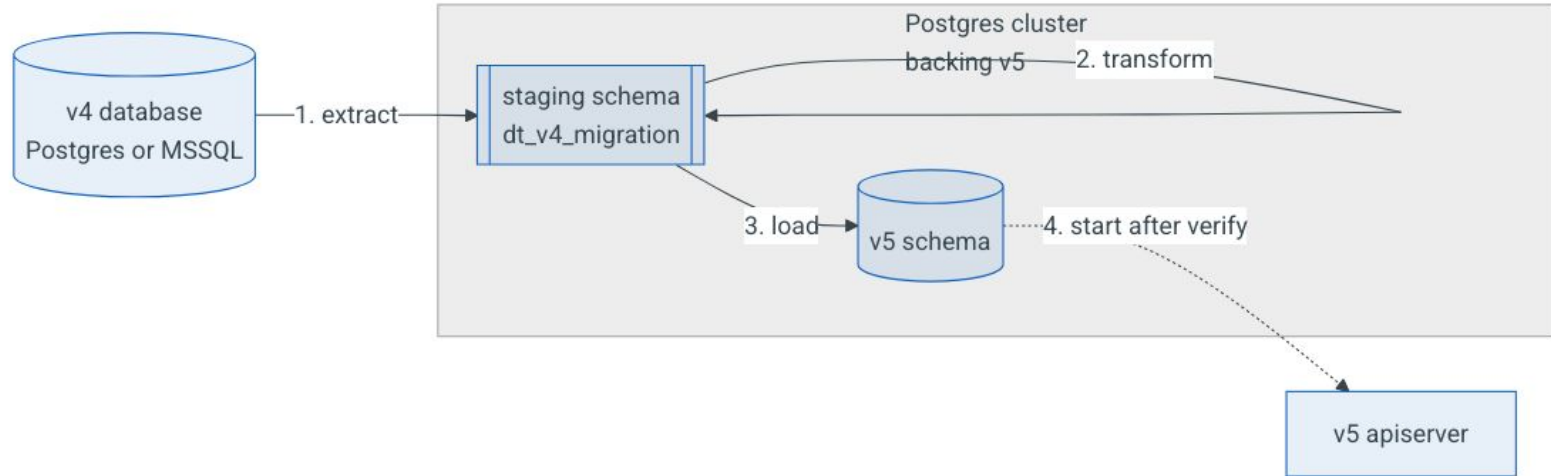

To walk this migration end to end against a sandbox v5 stack before the production cutover, see [Rehearsing the v4 to v5 migration](#).

Table of contents

- How the migration works
- Before you start
- Recommended Postgres tuning
- Run the migration
 1. Apply the v5 schema
 2. Verify the target
 3. Dry run
 4. Extract, transform, load
 5. Sample mode
 6. Verify the result
 7. Drop staging
- Lossy and non-obvious changes
 - Username collisions across user types
 - User records without a username
 - Portfolio access control bypass
 - Dedup of teams, OIDC groups,

<https://dependencytrack.github.io/docs/next/guides/administration/migrating-from-v4/>

v5 Update - Migration tooling & guide

v5 Update - Migration tooling & guide

- Requires the v4 instance to be on 4.14.2 or later
- Supports MSSQL and PostgreSQL source databases
- The migration is not in-place, but non-destructive and safe to repeat
- Dry-run and sampling modes included
- Please read and follow the guide closely, don't YOLO it
- If you run into issues, please report they can be fixed
- We expect having to push fixes for this even after GA release

v5 Update - Helm chart

- dependency-track Helm chart not yet v5-compatible 
 - Released v1.0.0 of the chart (this is the DT v4-compatible version)
 - Will add a check so that trying to deploy v4 with chart v1 fails fast
 - DT v5-compatible chart will be released as v2.0.0
 - v1.x -> v2.x will not be automatic, do not just increment the chart version!
 - Will put warnings / upgrade notes in prominent places
- hyades Helm chart planned to be discontinued
- New chart version will ship after v5 GA
 - Will support optional web / worker node split introduced in v5
 - Will ship a few RC releases to gather user feedback

v5 Update - What you can do now

- Make sure your v4 instance(s) are upgraded to 4.14.2
- Test the RC releases:
 - <https://github.com/DependencyTrack/dependency-track/releases?q=5.0.0-rc>.
 - <https://github.com/DependencyTrack/frontend/releases?q=5.0.0-rc>.
- Test the v4 -> v5 migration in a local sandbox:
 - <https://dependencytrack.github.io/docs/next/tutorials/rehearsing-the-v4-migration/>
- Plan / prepare production infrastructure for your v5 deployment:
 - <https://dependencytrack.github.io/docs/next/guides/administration/deploying-to-production/>
- Keep an eye out for the new Helm chart:
 - <https://github.com/DependencyTrack/helm-charts>

v5 Update – Early adopters

- For those who deployed alpha / RC versions
- Data migration not necessary
- Follow the upgrade guides to catch up to GA release version:
 - <https://dependencytrack.github.io/docs/next/guides/upgrading/>
